

CAMERA POSITIONING SYSTEM AND METHOD FOR EYE-TO-EYE COMMUNICATION

ABSTRACT OF THE DISCLOSURE

5 Eye-to-eye videoconferencing may be carried out through the use of a flexible coupling that removably disposes a camera between a screen portion of a display and a person viewing the screen portion. The camera may be attached to a camera portion of the flexible coupling, and a fixation portion of the flexible coupling may be secured to the display. According to one example, the flexible coupling is an elastic
10 or inelastic flexible loop that encircles the display. According to another example, the flexible coupling is a flexible line suspended from a base attached to a top side of the display.
